## Water Wells & Grouting

Grouting packers are a highly effective tool in preventing the infiltration of groundwater into structurally sound pipes or shafts. RIPE manufacture fixed-end and sliding end grouting inflatable packers and chemical grouting injection packers to order. We can also repair or refurbish your existing grouting packers that show signs of wear or damage.

sliding end packer

RIPE create replaceable elements that can be screwed to the packer mandrel prior to inflation. These multiple-sized configurations can bear a pressure rating of up to 10,000 psi. Our sliding end packers, with replaceable glands, are designed for use in fracture-testing, pressure grouting, ground-water hydrofracturing and for the multi-zonal testing of different aquifers.

## Rubber Roller Recovering & Grooving

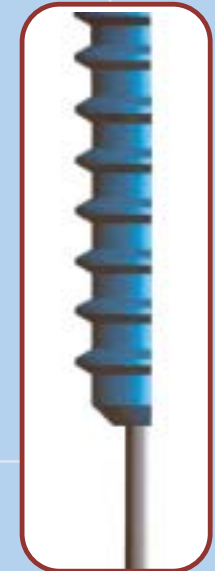

custom finishing

deep grooved machining

RIPE engineer at work on a custom grinding job

k-packer section

RIPE offer a wide range of customized rubber grinding & grooving services. We can provide deep-grooved machining for the refurbishment of casing patch relining. We can create custom seals to fit directly onto the outside of a drop pipe. The rubber can be vulcanized to the pipe casing then machine grooved to the correct diameter and sealing requirements.

We welcome enquiries from across Australia and internationally and will ship our packers to anywhere in the world. In fact, our prices, based on the value of the Australian dollar, are so competitive for overseas buyers that we challenge international operators to ask us for our quote!

We look forward to your call. **RIPE ... and ready!**
